Problem Statement

Roll No. :S051	Name:RAHUL YADAV
Class :SYIT	Batch : 01
Date of Assignment :15/07/2026	Date/Time of Submission :15/07/2026

A farmer wants a program to perform basic calculations related to farming.

The program should:

- Display the farmer's profile.

Code:

```
# Farmer Profile
```

```
name = "Rajesh"
```

```
age = 48
```

```
village = "Dhanbad"
```

```
print("=== Farmer Profile ===")
```

```
print("Name:", name)
```

```
print("Age:", age)
```

```
print("Village:", village)
```

```
print("Rahul_51")
```

Output:

```
=====
=== Farmer Profile ===
Name: Rajesh
Age: 48
Village: Dhanbad
Rahul_51
```

- Add the weights of two harvested crops.

Code:

```
crop1 = float(input("Enter weight of first crop (kg): "))
crop2 = float(input("Enter weight of second crop (kg): "))

total_weight = crop1 + crop2

print("Total harvested weight =", total_weight, "kg")
print("Rahul_51")
```

Output:

```
-----
Enter weight of first crop (kg): 22
Enter weight of second crop (kg): 54
Total harvested weight = 76.0 kg
Rahul_51
> |
```

- Find the square root of the total harvested area.

Code:

```
import math

area = float(input("Enter total harvested area (sq units): "))

square_root = math.sqrt(area)

print("Square root of harvested area =", square_root)

print("Rahul_51")
```

Output:

```
=====
Enter total harvested area (sq units): 256
Square root of harvested area = 16.0
Rahul_51
>
```

- Calculate the area of a triangular field.

Code:

```
Base = float(input("Enter the base of the triangle: "))

Height = float(input("Enter the height of the triangle: "))

area = 0.5 * Base * Height

print("Area of the triangular field is:", area, "square units")

print("Rahul_51")
```

Output:

```
-----  
Enter the base of the triangle: 12  
Enter the height of the triangle: 2  
Area of the triangular field is: 12.0 square units  
Rahul_51
```

- Swap the quantities of two fertilizer bags if entered in the wrong order.

Code:

```
bag1 = int(input("Enter the quantity of first fertilizer bag : "))  
bag2 = int(input("Enter the quantity of second fertilizer bag : "))  
temp = bag1  
bag1 = bag2  
bag2 = temp  
  
print("Swaping of Fertilizer Bags =", bag1, bag2)  
print("Rahul_51")
```

Output:

```
===== I  
Enter the quantity of first fertilizer bag : 48  
Enter the quantity of second fertilizer bag : 98  
Swaping of Fertilizer Bags = 98 48  
Rahul_51  
>> |
```
